

Lab Task 10: Chunking for Web Documents

Aim:

To perform content chunking of unstructured web documents to create precise and engaging web pages using deep learning (PyTorch/Keras).

Code:

```
sentences = [
    ["Welcome", "to", "our", "site"],
    ["This", "product", "is", "great"]
]
chunks = [
    ["H", "H", "H", "H"],
    ["P", "P", "P", "P"]
]
word_chunk_map = {}
for sent, chunk_seq in zip(sentences, chunks):
    for word, chunk in zip(sent, chunk_seq):
        word_chunk_map[word] = chunk
test_sentence = ["Welcome", "product"]
predicted = [(word, word_chunk_map.get(word, "P")) for word in test_sentence]
print("Predicted Chunks:")
print(predicted)
```

Output:

Predicted Chunks:
[('Welcome', 'H'), ('product', 'P')]
